EXPERIENCE

RX-PROM, Moscow/Novosibirsk **Software Developer**

NOVEMBER 2023 - JUNE 2025

Developed full-stack web applications for insurance companies, including frontend, backend APIs and deployment/hosting.

Initiated and developed a computer vision direction within the company for automated quality control in poultry production, using Python, OpenCV and YOLO.

Developed a production computer vision system for egg detection and recognition, which was deployed and used across 12 poultry farms in Russia.

Built and maintained the software and infrastructure required for on-site deployments, including Ubuntu Server, Docker, PostgreSQL and network-connected industrial cameras.

Performed on-site deployment and maintenance: physically installed Ethernet infrastructure, configured switches and network settings, configured hosts and connected/reconfigured cameras for operation within the required network.

Created an automated image annotation pipeline that used a previously trained model to generate annotations for new data, significantly reducing the amount of manual annotation required and accelerating dataset preparation and model iteration.

Prepared and curated datasets for subsequent model training, continuously improving model versions through iterative data collection, annotation and retraining.

Contributed to the company's robotics initiative by developing a vision-processing service responsible for processing images for a robotic system designed for

SKILLS

- Soft skills (teamwork, candidate's interview)
- Python 3.12 (OOP, asynchronous programming, multithreading, multiprocessing, gRPC, opencv, YOLO, FastAPI)
- JavaScript/TypeScript (Node.js, express.js, Next.js)
- HTML, CSS
- API (REST-API, Postman)
- Docker (CLI, compose)
- Linux (Ubuntu Desktop, Ubuntu Server, Debian)
- Git, GitBash, GitHub (code review, pull-requests, merging)
- Databases (PostgreSQL)
- Network (switches, Ethernet, setting up IP addresses, SSH-connection)

LANGUAGES

English (conversational, technical)

Russian (native)

automated soldering of microcomponents.

Designed and implemented Protocol Buffers (Protobuf) definitions and gRPC interfaces for communication between the robot's vision service and microcontroller interfaces developed by another team member in C#.

Developed internal Python tools and Shell scripts to automate repetitive tasks and improve the workflow of data annotation specialists.

Worked across multiple layers of production systems, from application development and APIs to Linux infrastructure, networking, cameras, databases and machine-learning data pipelines.

EDUCATION

Witte University , Moscow - *bachelor course* ***Faculty of Data Processing and Programming***

SEPTEMBER 2023 - JANUARY 2027

Currently studying by correspondence.

Tsaritsyno Information College, Moscow, ***Faculty of Web Development and Graphic Design***

SEPTEMBER 2020 - JUNE 2023

Coursework included web development, databases, Linux and software development, covering HTML, CSS, JavaScript, Node.js, React, MySQL, PostgreSQL and Ubuntu Linux.

Graduation Project: Developed a full-stack e-commerce marketplace application, including the client-side application, backend API and database.

Participated in two hackathons.

PROJECTS

"Autoannotator"

Professional Project - RX-PROM

Automatic markup and dataset generation based on a custom pre-trained model, automatic model retraining, automatic image preparation for markup from recordings of poultry farm video cameras.

Computer Vision Quality Control System

Professional Project - RX-PROM

Production computer vision system for automated egg

detection and quality control, deployed across 12 poultry farms in Russia. Developed Python-based image processing and model iteration pipelines and supported on-site Linux infrastructure.
